Effect Of Heat And Mass Transfer On An Oscillatory MHD Mixed Convection Past An Infinite Vertical Porous Plate With Variable Suction And Radiation

Daniel Simon
Department Of Mathematics, Kaduna State University – Nigeria

ABSTRACT

The effect of heat and mass transfer on an oscillatory MHD mixed convection past an infinite vertical porous plate with variable suction and radiation has been investigated. A uniform magnetic field is applied normal to the plate. A perturbation method was employed to solve the momentum equation, energy equation, species concentration equation, the skin friction, the Nusselt number and the Sherwood number. The effects of various parameters on velocity, temperature and concentration distribution profiles are considered and discussed in details through graphs and tables. However, our investigation of the problem setup leads to the following conclusion. The fluid motion is decelerated under the action of transverse magnetic field and radiation conduction parameter. Temperature falls due to effect of radiation and Prandtl numbers. The concentration distribution reduced with increase in Schmidt number and chemical parameter.

Keywords: Heat and Mass Transfer, Convection, Variable Suction, Oscillatory Flow, Radiation

1. INTRODUCTION

The problem of interaction of free and forced convection with thermal radiation of viscous incompressible MHD mixed convective flow past an infinite vertical porous plates with mass transfer are being studied nowadays due to the many applications of such problems in Astrophysics, Geophysical and different engineering fields. The heating of rooms and buildings by use of radiators is an example of heat transfer by free convection. The study of MHD is quite important in the field of aeronautics, especially in missile aerodynamics, since the temperature that occurs in such flight speed are sufficient to dissociate or even ionize the air appreciably. For example, when a high speed missile re-enters the earth’s atmosphere, a very large amount of heat is generated due to the friction of air molecules and this viscous heating may sometimes be so considerable as to ionize the air near the stagnation point. This ionized gas or plasma interacts with the magnetic field and alter the heat transfer and friction characteristics. In addition to this, some fluids can also emit and absorb thermal radiation. In such a situation, the study of the effect of the magnetic field on the flow is not only electrically conducting but also capable of emitting and absorbing thermal radiation. This type of investigation is carried out because of its importance in space and temperature related problems.

MHD is the science of motion of electrically conducting fluid in presence of magnetic field. There are numerous examples of application of MHD principles, these include MHD generators, MHD pumps and MHD flow meters etc. The dynamo and motor is a classical example of MHD principle. MHD principles also find its application in medicine and biology. The principle of MHD is also used in stabilizing a flow the transition from laminar to turbulent flow. Convection problems of electrically conducting fluid in the
presence of transverse magnetic field have got much importance because of its wide application in geophysics, Astrophysics, Plasma physics and missile technology etc. The present form of MHD is due to the pioneer contribution of several authors like Alfven (1942), Cowling (1957), Crammer and Pai (1978), Shercif (1968) and Ferraro and Pulmption (1966). Model studies on MHD free and forced convection with heat and mass transfer problems have been carried out by many of the authors due to their application in many branches of science and technology. Some of them are Ahmed (2010), Elbashbeshy (2003) and Singh and Singh (2000).

Radiation is a process of heat transfer through electromagnetic waves. Radiative conductive flows are encountered in industrial environment. For example heating and cooling chambers, fossil fuel combustion energy process, evaporation from large open water reservoirs, astrophysical flow etc. Radiative heat and mass transfer play an important role in manufacturing industries for the design of reliable equipment. If the temperature of the surrounding field is rather high, radiation effect play an important role in space related technology. The effect of radiation on various convective flows under different conditions has been studied by many researchers including Hussain and Takhar (1996), Ahmed and Sarmah (2009), Rajesh and Varma (2010) and Ahmed et al (2013). Radiation and free convection on the oscillatory flow past a vertical plate was studied by Mansour (1990). Ahmed and Sinha (2013) studied the soret effect on an oscillatory flow past an infinite vertical porous plate with variable suction.

2. PROBLEM FORMULATION

We now consider an unsteady MHD conductive flow of a viscous incompressible electrically conducting fluid past an infinite vertical porous plate with variable suction under the influence of a uniform transverse magnetic field. We introduced a coordinate system \((x', y', z')\) with \(X - axis\) vertically upwards along the plate, \(Y - axis\) perpendicular to the plate and directed into the fluid region and \(Z - axis\) along the width of the plate. Let the components of velocity along \(X\) and \(Y\) axes be \(u'\) and \(v'\). Let these velocity components chosen be along the upward direction of the plate and normal to the plate respectively.

Under these assumptions, the equations that describe the physical situation are given by

\[
\frac{\partial v'}{\partial y'} = 0
\]

\[
\frac{\partial u'}{\partial t} + v' \frac{\partial w}{\partial y'} = v \frac{\partial^2 u'}{\partial y'^2} + g\beta(T' - T'_\infty) + g\beta^*(C' - C'_\infty) - v' \frac{\partial^2 w}{\partial y'^2} - \frac{\sigma\beta^2 w}{\rho}
\]

\[
\frac{\partial T'}{\partial t} + v' \frac{\partial T'}{\partial y'} = \frac{K_T}{\rho c_p} \frac{\partial^2 T'}{\partial y'^2} - \frac{1}{\rho c_p} \frac{\partial q}{\partial y'}
\]

\[
\frac{\partial C'}{\partial t} + v' \frac{\partial C'}{\partial y'} = D \frac{\partial^2 C'}{\partial y'^2} - K'_c (C' - C'_\infty)
\]

All the physical quantities involved in the above equations are defined in the nomenclature.

The boundary conditions are:

\[
u' = 0, T' = T'_\infty + (1 + \varepsilon e^{i\omega t})(T'_w - T'_\infty), C' = C'_\infty + (1 + \varepsilon e^{i\omega t})(C'_w - C'_\infty)\quad \text{at}\quad y = 0
\]

\[
u' \rightarrow U' = U_0(1 + \varepsilon e^{i\omega t}), T' \rightarrow T'_\infty, C' \rightarrow C'_\infty\quad \text{as}\quad y = 1
\]
The equation (3.1) yield that the suction velocity at the plate is either a constant or a function of time and we take the suction velocity normal to the plate in the form

\[ V = -V_0(1 + \varepsilon A e^{i\omega t}) \]  \hspace{1cm} (2.6)

Where \( A \) is a real positive constant, \( \varepsilon \) is a small value less than unity, \( V_0 \) is a scale of function of suction velocity which is non-zero positive. The negative sign indicates that the suction is towards plate.

The radiative heat flux is given by

\[ \frac{\partial q}{\partial y} = 4\alpha^2(T_{\infty}' - T') \]  \hspace{1cm} (2.7)

In order to write the governing equations and the boundary conditions in the dimensional form, the following non-dimensional quantities are introduced:

\[ u = \frac{u}{\bar{V}_0}, v = \frac{v}{\bar{V}_0}, y = \frac{y}{\bar{V}_0}, U = \frac{U}{\bar{V}_0}, t = \frac{t \bar{V}_0^2}{4\mu}, \theta = \frac{T' - T_{\infty}'}{T_{w} - T_{\infty}}, C = \frac{C'_{-w} - C'_{\infty}}{C_{w} - C_{\infty}}, S_c = \frac{v}{D}, M = \frac{\sigma B_2 \bar{V}_0}{\rho \bar{V}_0^2}, G_r = \frac{v \beta g}{\bar{V}_0^2}, K = \frac{K_i \bar{V}_0^2}{\bar{V}_0^2}, K = \frac{K_i \bar{V}_0^2}{\bar{V}_0^2} \]  \hspace{1cm} (2.8)

In view of the equations (2.6)-(2.8), the equations (2.2)-(2.4) reduce to the following dimensional form:

\[ \frac{1}{4} \frac{\partial u}{\partial t} - \left( 1 + \varepsilon A e^{i\omega t} \right) \frac{\partial u}{\partial y} = \frac{\partial^2 u}{\partial y^2} + G_r \theta + G_m C - uB \hspace{0.5cm} \text{where} \hspace{0.5cm} B = u(1 + M) \]  \hspace{1cm} (2.9)

\[ \frac{1}{4} \frac{\partial \theta}{\partial t} - \left( 1 + \varepsilon A e^{i\omega t} \right) \frac{\partial \theta}{\partial y} = \frac{1}{\bar{\nu}} \frac{\partial^2 \theta}{\partial y^2} + N^2 \theta \]  \hspace{1cm} (2.10)

\[ \frac{1}{4} \frac{\partial C}{\partial t} - \left( 1 + \varepsilon A e^{i\omega t} \right) \frac{\partial C}{\partial y} = \frac{1}{S_c} \frac{\partial^2 C}{\partial y^2} - K_c C \]  \hspace{1cm} (2.11)

The corresponding boundary conditions are:

\[ u = 0, \theta = 1 + \varepsilon A e^{i\omega t}, C = 1 \hspace{0.5cm} \text{at} \hspace{0.5cm} y = 0 \]

\[ u \rightarrow U = 1 + \varepsilon e^{i\omega t}, \theta \rightarrow 0, C \rightarrow 0 \hspace{0.5cm} \text{as} \hspace{0.5cm} y \rightarrow 1 \]  \hspace{1cm} (2.12)

3. METHOD OF SOLUTION/SOLUTION OF THE PROBLEM

The momentum equation, energy equation and concentration equation can be reduced to the set of ordinary differential equations, which are solved analytically. This can be done by representing the velocity, temperature and concentration of the fluid in the perturbation series as follows

\[ u(y, t) = u_0(y) + \varepsilon u_1(y) e^{i\omega t} + o(\varepsilon^2) \]  \hspace{1cm} (3.1)

\[ \theta(y, t) = \theta_0(y) + \varepsilon \theta_1(y) e^{i\omega t} + o(\varepsilon^2) \]  \hspace{1cm} (3.2)

\[ C(y, t) = C_0(y) + \varepsilon C_1(y) e^{i\omega t} + o(\varepsilon^2) \]  \hspace{1cm} (3.3)
Substituting equations (3.1) – (3.3) into equations (2.9)-(2.12), equating the coefficients of harmonic and non-harmonic term and neglecting the coefficients of higher order of $\varepsilon^2$, we get:

\begin{align*}
  u''_0(y) + u'_0(y) - B u_0(y) &= G_r \theta_0(y) + G_m C_0(y) \\
  u''_1(y) + u'_1(y) - \left(\frac{i \omega}{4} + B\right) u_1(y) &= -A u'_0(y) - G_r \theta_1(y) - G_m C_1(y) \\
  \theta''_0(y) + P_r \theta'_0(y) + N^2 P_r \theta_0 y &= 0 \\
  \theta''_1(y) + P_r \theta'_1(y) - \left(\frac{i \omega}{4} - N^2\right) P_r \theta_1(y) &= -A P_r \theta_0(y) \\
  C''_0(y) - (K_c S_c - S_c) C_0(y) &= 0 \\
  C''_1(y) + S_c C'_1(y) - \left(\frac{i \omega}{4} + K_c\right) S_c C_1(y) &= -S_c A C'_0(y)
\end{align*}

The corresponding boundary condition become

\begin{align*}
  u_o &= 0, u_1 = 0, \theta_1 = 0, C_o \rightarrow 1 C_1 = 1 \ at \ y = 0 \\
  u_o &\rightarrow 1, u_1 \rightarrow 1, \theta_o \rightarrow 0, C_o \rightarrow 0, C_1 \rightarrow 0 \ as \ y \rightarrow 1
\end{align*}

We now solved equations (3.4) – (3.9) under the relevant boundary conditions for the mean flow and unsteady flow separately.

The mean flows are governed by the equations (3.4), (3.6) and (3.8) where $u_0$, $\theta_0$, $C_0$ are respectively called the mean velocity, mean temperature and mean species concentration respectively. The unsteady flows are governed by equations (3.5), (3.7) and (3.9) where $u_1$, $\theta_1$ and $C_1$ are the unsteady components.

These equations are solved analytically under the relevant boundary conditions (3.10) as follows;

Solving equations (3.6) and (3.8) subject to the corresponding relevant boundary conditions in (3.10), we obtain the mean temperature as

\begin{align*}
  \theta_0(y) &= A_5 e^{m_5 y} + A_6 e^{m_6 y} \\
  C_0(y) &= A_4 e^{m_4 y} + A_2 e^{m_2 y}
\end{align*}

Similarly, solving equations (3.7) and (3.9) under the relevant boundary conditions in (3.10), the unsteady temperature becomes

\begin{align*}
  \theta_1(y) &= A_7 e^{m_7 y} + A_8 e^{m_8 y} + B_3 e^{m_5 y} + B_4 e^{m_6 y} \\
  C_1(y) &= A_3 e^{m_3 y} + A_4 e^{m_4 y} + B_1 e^{m_1 y} + B_2 e^{m_2 y}
\end{align*}

Putting equations (3.11), (3.12) and equations (3.13) and (3.14) into equations (3.4) and (3.5) respectively and using the corresponding boundary conditions in (3.10), we obtain the mean velocity $u_0(y)$ and the unsteady velocity component $u_1(y)$ as follows;

\begin{align*}
  u_0(y) &= A_9 e^{m_9 y} + A_{10} e^{m_{10} y} + B_5 e^{m_5 y} + B_6 e^{m_6 y} + B_7 e^{m_7 y} + B_8 e^{m_8 y} \\
  u_1(y) &= A_9 e^{m_9 y} + A_{10} e^{m_{10} y} + B_5 e^{m_5 y} + B_6 e^{m_6 y} + B_7 e^{m_7 y} + B_8 e^{m_8 y}
\end{align*}
\[ u_1(y) = A_{11} e^{m_{11}y} + A_{12} e^{m_{12}y} + B_9 e^{m_9y} + B_{10} e^{m_{10}y} + B_{11} e^{m_{11}y} + B_{12} e^{m_{12}y} + B_{13} e^{m_{33}y} + B_{14} e^{m_{44}y} \] 

(3.16)

Therefore, the solutions for the velocity, temperature and species concentration profiles are

\[ u(y, t) = A_9 e^{m_9y} + A_{10} e^{m_{10}y} + B_5 e^{m_5y} + B_6 e^{m_6y} + B_7 e^{m_{11}y} + B_8 e^{m_{12}y} + \varepsilon [A_{11} e^{m_{11}y} + A_{12} e^{m_{12}y} + B_9 e^{m_9y} + B_{10} e^{m_{10}y} + B_{11} e^{m_{11}y} + B_{12} e^{m_{12}y} + B_{13} e^{m_{33}y} + B_{14} e^{m_{44}y}] e^{iot} \] 

(3.17)

\[ \theta(y, t) = A_5 e^{m_5y} + A_6 e^{m_6y} + \varepsilon [A_7 e^{m_{11}y} + A_8 e^{m_{12}y} + A_9 e^{m_{33}y} + B_3 e^{m_{33}y} + B_4 e^{m_{44}y}] e^{iot} \] 

(3.18)

\[ C(y, t) = A_1 e^{m_{11}y} + A_2 e^{m_{22}y} + \varepsilon [A_3 e^{m_{33}y} + A_4 e^{m_{44}y} + B_1 e^{m_{11}y} + B_2 e^{m_{22}y}] e^{iot} \] 

(3.19)

**Skin Friction:**

The skin friction \( \tau \) at the plate is given by

\[ \tau = \left( \frac{\partial u}{\partial y} \right)_{y=0} = A_9 m_9 + A_{10} m_{10} + B_5 m_5 + B_6 m_6 + B_7 m_1 + B_8 m_2 + \varepsilon [A_{11} m_{11} + A_{12} m_{12} + B_9 m_9 + B_{10} m_{10} + B_{11} m_7 + B_{12} m_8 + B_{13} m_3 + B_{14} m_4] e^{iot} \] 

(3.20)

**Nusselt number:**

The Nusselt number \( Nu \), that is, the rate of heat transfer at the plate is given by

\[ Nu = - \left( \frac{\partial \theta}{\partial y} \right)_{y=0} = -[A_5 m_5 + A_6 m_6 + \varepsilon (A_7 m_7 + A_8 m_8 + B_3 m_5 + B_4 m_6)] e^{iot} \] 

(3.21)

**Sherwood number:**

The Sherwood number, that is, the rate of mass transfer at the plate is given by

\[ Sh = - \left( \frac{\partial C}{\partial y} \right)_{y=0} = -[A_1 m_1 + A_2 m_2 + \varepsilon (A_3 m_3 + A_4 m_4 + B_1 m_1 + B_2 m_2)] e^{iot} \] 

(3.22)

### 4. RESULTS AND DISCUSSION

In order to study the effect of heat and mass transfer on an oscillatory MHD mixed convection past an infinite vertical porous plate with variable suction and radiation, the solution for non-dimensional velocity field, temperature and species concentration have been carried out using Matlab by assigning some specific arbitrary value to the different parameters involved in the problem, namely, Hartmann number \( M \), Grashof numbers \( Gr \) and \( Gm \), Schmidt number \( Sc \), Prandtl number \( Pr \), chemical parameter \( K_c \), Reynold number \( Re \) and Radiation parameter \( N \). The effects of these values are demonstrated through different graphs and table.

Figure 1 illustrates the effect of modified Grashof number \( Gm \) on velocity \( u \). It is simulated from this figure that an increase in the modified Grashof number \( Gm \) on velocity profile, that is, the fluid motion is accelerated for increasing the permeability of the medium.

Figure 2 demonstrates the effect Grashof number \( Gr \) on velocity \( u \). It is inferred from the figure that under the action of the Grashof number \( Gr \), the fluid motion is accelerated. We recall that the Grashof parameter.
increases means that the free stream velocity is enhanced due to increase in the free stream velocity i.e. the boundary layer velocity is enhanced due to increase in the free stream velocity.

Figure 3 presents the effect of Hartman number $M$ on velocity $u$. It is inferred from this figure that an increase in the Hartman number $M$ lead to the decrease of the fluid velocity.

Figure 4 exhibits the effect of Radiation parameter $N$ on velocity $u$. It is simulated from this figure that an increase in the Radiation parameter $N$ lead to the decrease of the fluid motion.

Figure 5 shows the effect of Reynold number $Re$ on velocity $u$. It means that if the Reynold number $Re$ decrease the fluid velocity will decrease.

Figure 6 illustrates the effect of Radiation parameter $N$ on temperature $\theta$. It is inferred that an increase in the Radiation parameter $N$ will lead to the decrease in the temperature $\theta$.

Figure 7 show the effect of Prandtl number $Pr$ on temperature $\theta$. It is simulated from this figure that an increase to the Prandtl number lead to the decrease of the temperature $\theta$.

Figures 8 and 9 illustrate the effect of Chemical parameter $K_c$ and the Schmidt number $Sc$ on the Species Concentration. It is simulated from this figure that an increase in the Chemical parameter $K_c$ and Schmidt number $Sc$ lead to the decrease of the Species Concentration.

Table 1 shows the variation of Skin friction $\tau$, Nusselt number $Nu$ and Sherwood number $Sh$ with time $t$. It can be observed that the skin friction increases with increase in time, the Nusselt number decreases with increase in time and the Sherwood number decreases with increases with increase in time.

5. SUMMARY AND CONCLUSION

In this section, we studied the effect of heat and mass transfer on an oscillatory mixed convective flow in an infinite vertical porous plate with variable suction and radiation. The governing equations, the momentum, energy and species concentration equations have been written in dimensionless form using dimensionless parameter. The regular perturbation technique has been employed to evaluate and solve the dimensionless velocity $u$, temperature $\theta$, the species concentration $C$, Skin friction $\tau$, Nusselt number $Nu$ and Sherwood number $Sh$.

However our investigation of the problem setup leads to the following conclusions:

- The fluid motion is decelerated under the action of transverse magnetic field and radiation conduction parameter.
- Temperature falls due to effect of radiation and Prandtl numbers.
- The concentration distribution reduced with increase in Schmidt number and chemical parameter.
