### Abstract

The purpose of this paper is to study the properties of q-b open sets and q-b closed sets and introduce q-continuous function in quad topological spaces (q-topological spaces).

**Keywords-** Quad topological spaces, q-b open sets, q-b interior , q-b closure ,q-b continuous function.

### 1.INTRODUCTION

J .C. Kelly <sup>[1]</sup> introduced bitopological spaces in 1963. The study of tri-topological spaces was first initiated by Martin M. Kovar <sup>[2]</sup> in 2000, where a non empty set X with three topologies is called tri-topological spaces. Tri  $\alpha$  Continuous Functions and tri  $\beta$  continuous functions introduced by S. Palaniammal <sup>[4]</sup> in 2011. D.V. Mukundan <sup>[3]</sup> introduced the concept on topological structures with four topologies, quad topology (4-tuple topology ) and defined new types of open (closed) set . In year 2011 Luay Al-Sweedy and A.F.Hassan defined  $\delta^{**}$ -continuous function in tritopological space. In this paper, we study the properties of q-b open sets and q-b closed sets and q-b continuous function in quad topological space (q-topological spaces).

### 2. PRILIMINARIES

Definition 2.1 [3] :Let X be a nonempty set and  $T_1, T_2, T_3$  and  $T_4$  are general topologies on X. Then a subset A of space X is said to be quad-open(q-open) set if  $A \subset T_1 \cup T_2 \cup T_3 \cup T_4$  and its complement is said to be q-closed and set X with four topologies called q-topological spaces  $(X, T_1, T_2, T_3, T_4)$  .q-open sets satisfy all the axioms of topology.

**Definition 2.2 [3]** : A subset  $A$  of a space  $X$  is said to be  $q$ - $b$  open set if

$$A \subset q - cl(q - intA) \cup q - int(q - clA).$$

Note 2.3[3] : We will denote the  $q$ - $b$  interior (resp.  $q$ - $b$  closure) of any subset ,say of  $A$  by  $q$ -  $b$   $intA$  ( $q$ - $b$   $clA$ ),where  $q$ - $b$   $intA$  is the union of all  $q$ - $b$  open sets contained in  $A$ , and  $q$ - $b$   $clA$  is the intersection of all  $q$ - $b$  closed sets containing  $A$ .

3.1  $q$ - $b$  open &  $q$ - $b$  closed sets:

**Theorem3.1.1:** Arbitrary union of  $q$ - $b$  open sets is  $q$ - $b$  open.

**Proof:** Let  $\{A_\alpha / \alpha \in I\}$  be a family of  $q$ - $b$  open sets in  $X$ .

For each  $\alpha \in I, A \subset q - cl(q - intA) \cup q - int(q - clA)$ .

Therefore  $\cup A \subset [\cup \{q - cl(q - intA)\}] \cup [\cup \{q - int(q - clA)\}]$ .

$$\cup A \subset \{q - cl(q - \cup intA)\} \cup \{q - int(q - \cup clA)\}.$$

(by definition of  $q$ - $b$  open sets).Therefore  $\cup A_\alpha$  is  $q$ - $b$  open .

**Theorem3.1.2:**Arbitrary intersection of  $q$ - $b$  closed sets is  $q$ - $b$  closed.

**Proof:** Let  $\{B_\alpha / \alpha \in I\}$  be a family of  $q$ - $b$  closed sets in  $X$ .

Let  $A_\alpha = B_\alpha^c$ .  $\{A_\alpha / \alpha \in I\}$  be a family of  $q$ - $b$  open sets in  $X$ .

Arbitrary union of  $q$ - $b$  open sets is  $q$ - $b$  open .Hence  $\cup A_\alpha$  is  $q$ - $b$  open and hence  $(\cup A_\alpha)^c$  is  $q$ - $b$  closed i.e  $\cap A_\alpha^c$  is  $q$ -closed i.e  $\cap B_\alpha$  is  $q$ - $b$  closed. Hence arbitrary intersection of  $q$ - $b$  closed sets is  $q$ - $b$  closed.

Note 3.1.3: 1. $q - b$   $int A \subset A$ .

2.  $q - b$   $int A$  is  $q$ -  $b$  open.

3.  $q$ -  $b$   $int A$  is the largest  $q$ - $b$  open set contained in  $A$ .

**Theorem 3.1.4:**  $A$  is  $q$ -  $b$  open iff  $A = q - b$   $int A$ .

**Proof:**  $A$  is  $q$ - $b$  open and  $A \subset A$ . Therefore  $A \in \{B / B \subset A, B$  is  $q$ - $b$  open}

$A$  is in the collection and every other member in the collection is a subset of  $A$  and hence the union of this collection is  $A$ . Hence  $\cup \{B / B \subset A, B$  is  $q$ - $b$  open} =  $A$

and hence  $q - b$   $int A = A$ .

Conversely since  $q - b$   $int A$  is  $q$ - $b$  open,

$A = q - b$   $int A$  implies that  $A$  is  $q$ -  $b$  open.

**Theorem 3.1.5:**  $q - b \text{ int } (A \cup B) \supseteq q - b \text{ int } A \cup q - b \text{ int } B$

**Proof:**  $q - b \text{ int } A \subset A$  and  $q - b \text{ int } A$  is  $q - b$  open.

$q - b \text{ int } B \subset B$  and  $q - b \text{ int } B$  is  $q - b$  open.

Union of two  $q - b$  open sets is  $q - b$  open and hence  $q - b \text{ int } A \cup q - b \text{ int } B$  is a  $q - b$  open set.

Also  $q - b \text{ int } A \cup q - b \text{ int } B \subset A \cup B$ .

$q - b \text{ int } A \cup q - b \text{ int } B$  is one  $q - b$  open subset of  $A \cup B$  and  $q - b \text{ int } (A \cup B)$  is the largest  $q - b$  open subset of  $A \cup B$ .

Hence  $q - b \text{ int } (A \cup B) \supseteq q - b \text{ int } A \cup q - b \text{ int } B$ .

**Definition 3.1.6[3]:** Let  $(X, T_1, T_2, T_3, T_4)$  be a quad topological space and let

$A \subset X$ . The intersection of all  $q - b$  closed sets containing  $A$  is called the  $q - b$  closure of  $A$  & denoted by  $q - b \text{ cl } A$ .  $q - b \text{ cl } A = \cap \{ B / B \supseteq A, B \text{ is } q - b \text{ closed} \}$ .

Note 3.1.7: Since intersection of  $q - b$  closed sets is  $q - b$  closed,  $q - b \text{ cl } A$  is a  $q - b$  closed set.

Note 3.1.8:  $q - b \text{ cl } A$  is the smallest  $q - b$  closed set containing  $A$ .

**Theorem 3.1.9:**  $A$  is  $q - b$  closed iff  $A = q - b \text{ cl } A$ .

**Proof:**  $q - b \text{ cl } A = \cap \{ B / B \supseteq A, B \text{ is } q - b \text{ closed} \}$ .

If  $A$  is a  $q - b$  closed then  $A$  is a member of the above collection and each member contains  $A$ . Hence their intersection is  $A$ . Hence  $q - b \text{ cl } A = A$ . Conversely if  $A = q - b \text{ cl } A$ , then  $A$  is  $q - b$  closed because  $q - b \text{ cl } A$  is a  $q - b$  closed set.

**Definition 3.1.10:** Let  $A \subset X$ , be a quad topological space.  $x \in X$  is called a  $q - b$  limit point of  $A$ , if every  $q - b$  open set  $U$  containing  $x$ , intersects  $A - \{x\}$ . (ie) every  $q - b$  open set containing  $x$ , contains a point of  $A$  other than  $x$ .

### 3.2: $q - b$ continuous function

**Definition 3.2.1:** Let  $(X, T_1, T_2, T_3, T_4)$  and  $(Y, T_1', T_2', T_3', T_4')$  be two quad topological spaces. A function  $f: X \rightarrow Y$  is called a  $q - b$  continuous function if  $f^{-1}(V)$  is  $q - b$  open in  $X$ , for every  $q - b$  open set  $V$  in  $Y$ .

Example 3.2.2: Let  $X = \{1, 2, 3, 4\}$ ,  $T_1 = \{\emptyset, \{1\}, X\}$ ,  $T_2 = \{\emptyset, \{1\}, \{1, 3\}, X\}$

$T_3 = \{\emptyset, \{1\}, \{1, 2\}, X\}$ ,  $T_4 = \{\emptyset, \{4\}, \{1, 4\}, X\}$

Let  $Y = \{a, b, c, d\}$ ,  $T_1' = \{\emptyset, \{a\}, Y\}$ ,  $T_2' = \{\emptyset, \{a\}, \{a, c\}, Y\}$ ,

$$T_3' = \{\emptyset, \{a\}, \{a, b\}, Y\}, T_4' = \{\emptyset, \{d\}, \{a, d\}, Y\}$$

Let  $f : X \rightarrow Y$  be a function defined as  $f(1) = a; f(2) = b; f(3) = c; f(4) = d$

q-open sets in  $(X, T_1, T_2, T_3, T_4)$  are  $\emptyset, \{1\}, \{1,2\}, \{1,3\}, \{4\}, \{1,4\}, X$ .

q-open sets in  $(Y, T_1', T_2', T_3', T_4')$  are  $\emptyset, \{a\}, \{a, b\}, \{a, c\}, \{d\}, \{a, d\}, Y$ .

q-b open sets in  $(X, T_1, T_2, T_3, T_4)$  are  $X, \emptyset, \{1\}, \{4\}, \{1,2\}, \{1,3\}, \{1,4\}, \{2,3\}, \{1,2,3\}$ .

q-b open sets in  $(Y, T_1', T_2', T_3', T_4')$  are  $Y, \emptyset, \{a\}, \{d\}, \{a, b\}, \{a, c\}, \{a, d\}, \{b, c\}, \{a, b, c\}$ .

Since  $f^{-1}(V)$  is q-b open in  $X$  for every q-b open set  $V$  in  $Y$ ,

$f$  is q-b continuous.

**Definition 3.2.3 :** Let  $X$  and  $Y$  be two q-topological spaces. A function

$f: X \rightarrow Y$  is said to be q-bcontinuous at a point  $a \in X$  if for every q-b open set  $V$  containing  $f(a)$ ,  $\exists$  a q-b open set  $U$  containing  $a$ , such that  $f(U) \subset V$ .

**Theorem 3.2.4:**  $f: X \rightarrow Y$  is q-b continuous iff  $f$  is q-b continuous at each point of  $X$ .

**Proof:** Let  $f: X \rightarrow Y$  be q-b continuous.

Take any  $a \in X$ . Let  $V$  be a q-b open set containing  $f(a)$ .

$f: X \rightarrow Y$  is q-b continuous, Since  $f^{-1}(V)$  is q-b open set containing  $a$ .

Let  $U = f^{-1}(V)$ . Then  $f(U) \subset V \Rightarrow \exists$  a q-b open set  $U$  containing  $a$  and  $f(U) \subset V$

Hence  $f$  is q-b continuous at  $a$ .

Conversely, Suppose  $f$  is q-b continuous at each point of  $X$ .

Let  $V$  be a q-b open set of  $Y$ . If  $f^{-1}(V) = \emptyset$  then it is q-b open.

Take any  $a \in f^{-1}(V)$   $f$  is q-b continuous at  $a$ .

Hence  $\exists U_a$ , q-b open set containing  $a$  and  $f(U_a) \subset V$ .

Let  $U = \cup \{ U_a / a \in f^{-1}(V) \}$ .

Claim:  $U = f^{-1}(V)$ .

$a \in f^{-1}(V) \Rightarrow U_a \subset U \Rightarrow a \in U$ .

$x \in U \Rightarrow x \in U_a$  for some  $a \Rightarrow f(x) \in V \Rightarrow x \in f^{-1}(V)$ . Hence  $U = f^{-1}(V)$

Each  $U_a$  is q-b open. Hence  $U$  is q-b open.  $\Rightarrow f^{-1}(V)$  is q-b open in  $X$ .

Hence  $f$  is q-b continuous.

**Theorem 3.2.5:** Let  $(X, T_1, T_2, T_3, T_4)$  and  $(Y, T_1', T_2', T_3', T_4')$  be two q-topological spaces.

Then

$f: X \rightarrow Y$  is q-b continuous function iff  $f^{-1}(V)$  is q-b closed in X whenever V is q-b closed in Y.

**Proof:** Let  $f: X \rightarrow Y$  be q-b continuous function.

Let V be any q-b closed in Y.

$\Rightarrow V^c$  is q-b open in Y  $\Rightarrow f^{-1}(V^c)$  is q-b open in X.

$\Rightarrow [f^{-1}(V)]^c$  is q-b open in X.

$\Rightarrow f^{-1}(V)$  is q-b closed in X.

Hence  $f^{-1}(V)$  is q-b closed in X whenever V is q-b closed in Y.

Conversely, suppose  $f^{-1}(V)$  is q-b closed in X whenever V is q-b closed in Y.

V is a q-b open set in Y.

$\Rightarrow V^c$  is q-b closed in Y.

$\Rightarrow f^{-1}(V^c)$  is q-b closed in X.

$\Rightarrow [f^{-1}(V)]^c$  is q-b closed in X.

$\Rightarrow f^{-1}(V)$  is q-b open in X.

Hence f is q-b continuous.

**Theorem 3.2.6:** : Let  $(X, T_1, T_2, T_3, T_4)$  and  $(Y, T_1', T_2', T_3', T_4')$  be two q-topological spaces..Then,  $f: X \rightarrow Y$  is q-b continuous iff  $f[q - cl A] \subset q - cl [f(A)] \quad \forall A \subset X$ .

**Proof:** Suppose  $f: X \rightarrow Y$  is q-b continuous. Since  $q - b cl [f(A)]$  is q-b closed in Y. Then by theorem (3.2.5)  $f^{-1}(q - cl [f(A)])$  is q-b closed in X,

$$q - b cl [f^{-1}(q - b cl(f(A)))] = f^{-1}(q - b cl(f(A))) \text{ --- (1)}$$

$$\text{Now : } f(A) \subset q - b cl [f(A)], A \subset f^{-1}(f(A)) \subset f^{-1}(q - b cl(f(A))).$$

Then  $q - b cl(A) \subset q - b cl [f^{-1}(q - b cl(f(A)))] = f^{-1}(q - b cl(f(A)))$  by (1).

$$\text{Then } f(q - b cl(f(A))) \subset q - b cl(f(A)).$$

Conversely, Let  $f(q - b cl(A)) \subset q - b cl(f(A)) \quad \forall A \subset X$ .

Let F be q-b closed set in Y ,so that  $q - b cl(F) = F$ . Now  $f^{-1}(F) \subset X$  ,by hypothesis,

$$f(q - b cl(f^{-1}(F))) \subset q - b cl(f(f^{-1}(F))) \subset q - b cl(F) = F .$$

Therefore  $q - b cl(f^{-1}(F)) \subset f^{-1}(F)$ . But  $f^{-1}(F) \subset q - b cl(f^{-1}(F))$  always.

Hence  $q - b \text{ cl}(f^{-1}(F)) = f^{-1}(F)$  and so  $f^{-1}(F)$  is q-b closed in  $X$ .

Hence by theorem (3.2.5)  $f$  is q- b continuous.

### 3.3: q- b Homomorphism

**Definition 3.3.1:** Let  $(X, T_1, T_2, T_3, T_4)$  and  $(Y, T_1', T_2', T_3', T_4')$  be two q-topological spaces. A function  $f: X \rightarrow Y$  is called q-b open map if  $f(V)$  q-b open in  $Y$  for every q-b open set  $V$  in  $X$ .

**Example 3.3.2:** In example 3.2.2  $f$  is q-b open map also.

**Definition 3.3.3:** Let  $(X, T_1, T_2, T_3, T_4)$  and  $(Y, T_1', T_2', T_3', T_4')$  be two q-topological spaces. Let  $f: X \rightarrow Y$  be a mapping.  $f$  is called q- b closed map if  $f(F)$  is q-b closed in  $Y$  for every q-b closed set  $F$  in  $X$ .

**Example 3.3.4:** The function  $f$  defined in the example 3.2.2 is q-b closed map.

**Result 3.3..5:** Let  $X$  &  $Y$  be two q-topological spaces. Let  $f: X \rightarrow Y$  be a mapping.  $f$  is q-b continuous iff  $f^{-1} : Y \rightarrow X$  is q-b open map.

**Definition 3.3.6:** Let  $(X, T_1, T_2, T_3, T_4)$  and  $(Y, T_1', T_2', T_3', T_4')$  be two q-b topological spaces. Let  $f: X \rightarrow Y$  be a mapping.  $f$  is called a q-b homeomorphism.

If (i)  $f$  is a bijection.

(ii)  $f$  is q-b continuous.

(iii)  $f^{-1}$  is q-b continuous.

**Example 3.3.7:** The function  $f$  defined in the example 3.2.2 is

(i) a bijection. (ii)  $f$  is q-b continuous. (iii)  $f^{-1}$  is q-b continuous.

Therefore  $f$  is a q-b homeomorphism.

### CONCLUSION:

In this paper the idea of q-b continuous function in quad topological spaces were introduced and studied, Also properties of q-b open and q-b closed sets were studied.
